

Does the arm preserve WHICH personas sit where? — layer 20

Error bars: 95% question-resampling CI. `impulsiveness` reorders personas overall (+0.30 [0.08,0.49]) where goodness (+0.75) and mathematical (+0.73) do not — those intervals do not overlap. Its point estimates invert on impulsivity (its target) and risk_taking, but each single-trait interval still contains 0, so the localisation is suggestive, not established.
